

Strategic Plan

We would like to achieve a botanical garden devoted to trees being cultivated with the purpose of scientific, biblical, and community interests. Our plan is to track tree growth (diameter) rates and monitor bird species changes as the number of trees increase and the existing trees mature. The arboretum will also serve the purpose of teaching tree identification through use of a dichotomous key and learning the unique features of each tree. As trees mature we will be placing different birdhouses to try and encourage more species diversity. Our primary audience will be Unity Christian High School students as well as grade school students. Trees will be the main plant which will be grown for the arboretum.
